## PRIORITY DOCUMENT

SUBMITTED OR TRANSMITTED IN  
COMPLIANCE WITH RULE 17.1(a) OR (b)

REC'D 03 APR 2003

WIPO PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

## Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

## Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

IMPROVEMENTS IN AND RELATING TO THE FILLING OF EXPLOSIVE  
ORDNANCE

This invention relates to the field of the filling of ordnance with explosive materials, and more specifically to the use of static mixing in the filling process.

Traditional methods used for filling ordnance with polymer bonded explosive (PBX) utilise a filling process based on the combination of usually two materials, namely an explosive mixture (pre-mix) and hardener, which are mixed together immediately prior to use in filling the chosen ordnance.

In a typical application of the mixing and filling process, a pre-mix of explosive such as for example PBX is produced and typically mixed with a hardener (i.e. IPDI) the combined mixture being mixed together in a high shear mixer.

Once mixed, the bowl of the high shear mixer containing the fully mixed PBX composition is fitted with a pressure plate apparatus and cover, then raised to an appropriate filling height on a specialised bowl lift.

Once elevated into position, the bowl of fully mixed PBX composition is pressurised using an inert gas (i.e. nitrogen) for the purposes of aiding the dispensing of the fully mixed PBX composition through a system of pipes to the ordnance filling position.

Ordnance to be filled is typically placed in a vacuum chamber and a filling attachment from the bottom outlet valve of the mixer bowl containing the

- 2 -

fully mixed PBX composition is attached to the chamber. Typically the vacuum will be evacuated to < 50 millibars.

5 The vacuum provides the physical motivation for the fully mixed PBX composition to flow into the ordnance when the valve from the bottom outlet of the mixer bowl is released. The quantity of fully mixed PBX composition introduced to the cavity within the ordnance is usually judged visually, and when sufficiently filled the vacuum to the chamber is released and the filled component removed ready for the introduction of the next ordnance component  
10 to be filled.

The traditional method of filling ordnance as described above suffers from a number of problems associated with the finite "pot life" time of the fully mixed PBX composition and the fact that once the various chemicals have  
15 been combined the 'pot life' time defines the period within which the filling process must be completed before the PBX composition cures and can no longer be used in the process (i.e. would solidify within the pipe work).

The "pot life" is typically in the order of two hours and in instances where  
20 there are no problems associated with a particular batch of components, then the mixing of PBX and hardener (IPDI) in a bowl and the subsequent dispensing of the fully mixed PBX composition into ordnance can be achieved relatively quickly. However, if for any reason (for example mechanical breakdown etc) the filling process has to be interrupted or indeed suspended,  
25 then the whole of the fully mixed PBX composition has to be purged from the mixing and filling apparatus, the purged material being lost to waste.

The invention described herein provides for apparatus and a method for the mixing of explosive compositions and the subsequent filling of ordnance

- 3 -

without being subject to the problems associated with having to mix and use a specific quantity of explosive composition within a limited "pot life" period.

Accordingly there is provided apparatus for the mixing of explosive materials, comprising;

- a reservoir of pre-mixed explosive material,
- a reservoir of hardener material,
- a static mixer means,

each of said reservoirs having pipe means for conveying said pre-mix explosive material and hardener material respectively into the inlet of a static mixer means, the outlet of said static mixer means being connected to means for effecting the filling of ordnance components.

Preferably the pipe means for conveying each of said materials are not linked or combined until they reach the inlet of said static mixer means.

Preferably the means for filling each of said ordnance components with said final mixed explosive material will be controlled such that the respective pre-mix explosive material and the hardener materials are introduced to the static mixer means on demand, thereby minimising the amount of combined explosive material in said apparatus to that contained in the static mixer means itself and the associated pipe-work used to connect the output of said static mixer unit to the ordnance for filling.

Additionally there is provided a method for the mixing of materials and the subsequent filling of ordnance components comprising the use of,

- a reservoir of pre-mixed explosive material,

- 4 -

a reservoir of hardener material,

a static mixer means,

each of said reservoirs having pipe means for conveying said pre-mix explosive material and hardener material respectively into the inlet of a static mixer means, the outlet of said static mixer means being connected to means  
5 for effecting the filling of ordnance components.

The invention is now described by way of example only with reference to the following drawing in which figure 1 is a diagrammatic representation of an  
10 explosive mixing and ordnance filling apparatus in accordance with the invention

Figure 1 shows a pre-mix explosive material 2 is shown in a high shear mixing bowl assembly 4 wherein the mixing of the pre-mix explosive material 2 has  
15 been completed and the pre-mix explosive material 2 held within the mixing bowl 4 subjected to controlled pressure by the action of a hydraulic cylinder 6 and ram 8 assembly. Hydraulic cylinder control means 10 is shown for controlling the flow of pre-mix explosive material 2 through the exit valve 12 and onwards through the pre-mix explosive material pipe work 14.

20

Hardener material 16 is depicted housed within a header tank 18 having pipe work 20 leading to a pump means 22 to provide the controlled supply of hardener material 16 through the pipe work 24.

25 A static mixer means 26 is provided having pipe work 14 and 24 at its inlet port 28 and an outlet port 30 and corresponding pipe work 32 for conveying final mixed explosive material 34 to ordnance filling stations 36.

- 5 -

- In use, ordnance 38 to be filled with final mixed explosive composition 34 are positioned at ordnance filling stations 36. When the ordnance is correctly in position 38 and the associated fill-to-level control apparatus is connected (not shown), a signal from the process control 40 to initiate the filling operation is activated. A demand signal is received by the fill-to-level controller 42 from the fibre optic controller 46 indicating that the ordnance is not filled and accordingly the fill level controller 42 sends a demand signal to the pre-mix explosive material hydraulic cylinder controller 10 and the hardener material pump 22.
- 10 The pre-mix explosive material 2 and hardener material 16 are conveyed through their respective separate pipe works 12, 24, both materials 2, 16 being introduced individually to the inlet 28 of the static mixer means 26. It is important to note at this point that in accordance with the invention the point at which the pre-mix explosive material 2 and hardener material 16 are first
- 15 combined is substantially at the inlet port 28 of the static mixer means 26 thereby providing a distinguishing feature over the prior art in which the two materials are normally combined in the mixing bowl, thereby starting the 'pot life' for the combined explosive material within the mixing bowl 4.
- 20 At the inlet 28 of the static mixer means 26 the pre-mix explosive material 2 and hardener material 16 are forced through a number of static mixing blade means 4, thereby mixing the two materials 2, 16 together. Such static mixing means are known within the confectionery and food industries and typically comprise a plurality of blade means arranged in a 'corkscrew' type manner which promotes
- 25 the effective mixing together of two or more materials when forced through the mixer.

Additionally, the use of a static mixing means provides for simplified cleaning of the apparatus following the completion of an ordnance filling run, thereby

- 6 -

further reducing the inherent complexity and time required for purging and cleaning using state of the art apparatus.

The combined final explosive mixture 34 passes through the static mixer means  
5 exit port 30 and along the pipe-work 32 arriving at the ordnance filling stations  
36. At the filling stations 36 the flow of combined explosive mixture 34 into the  
waiting ordnance 38 is controlled via pinch valves 44, the operation of said  
pinch valves 44 being controlled so as to limit the volume of combined final  
explosive mixture 34 introduced into the ordnance 38. A vacuum source 48 is  
10 provided to encourage the filling of the volume within the ordnance.

The control of the valves 44 (typically pinch valves) to enable the accurate filling  
of the ordnance may be effected either by a human operator directly controlling  
a valve 44 or by a mechanised system, which for the purposes of this specific  
15 embodiment utilises a fibre optic fill level controller 46 which forms part of an  
integrated control system 10,40,42,46,48.

When the fibre optic fill-to-level controller 46 senses that ordnance 38 requires  
filling with combined final explosive mix 34, then a signal is sent to the fill-to-  
20 level controller 42 which in turn initiates the flow of both pre-mix explosive  
material 2 and hardener material 16 through the static mixing means 42 and via  
the outlet pipe work into the waiting ordnance 38. When the fibre optic fill-to-  
level controller senses that any of the ordnance 38 has reached its fill limit, then  
a signal is sent to the fill-to-level controller 2 to stop the flow of materials 2 and  
25 16.

Using the above stated control means thereby provides for both apparatus and  
a method of filling ordnance 38 with combined final explosive mixture 34 in a  
controlled manner, utilising apparatus that prolongs the 'pot life' of said

- 7 -

combined final explosive material 34. This resulting in significantly less waste explosive material to be disposed of and additionally simplifies the cleaning of the system by minimising the number of elements of the apparatus actually exposed to combined final explosive material 34. The method of filling  
5 ordnance 38 using such apparatus and control means can provide an automated ordnance filling system.

In order to clean the apparatus as described, the action of pumping pre-mix explosive material 2 (or an alternative compatible inert material) through the  
10 apparatus in the absence of any hardener material 16 will be substantially sufficient to purge the system of any combined final explosive material 34, thereby reducing the complexity, time and danger level associated with purging state of the art apparatus within which combined final explosive material has been allowed to cure.

15

In addition to the elements described in the specific embodiment of the invention, a number of measuring sensors and safety devices would also be incorporated into the apparatus as shown in figure 1, namely a flow meter sensor 50, a pressure sensor 52, temperature probes 56, a pressure switch 58  
20 and a safety burst disc 60. Such sensors and safety devices are known in the art and are included in the specific embodiment by way of example to illustrate the industrial application of the invention.

Additionally, a colour agent or dye can be added to the hardener material 16  
25 such that it will be possible to monitor the amount of hardener 16 present in the final combined explosive mixture 34. The analysis of the colour of the combined mixture 34 may be made by utilising a colour sensor means located after the mixing process calibrated to recognise particular ranges of colour as indicating sufficient percentage of hardener in the combined material 34, or by use of a

- 8 -

viewing window in the pipe work containing the combined mixture 34 to allow for visual inspection of the colour of said mixture 34.

5 Other advantages of the invention will be readily apparent to those skilled in the art and the substitution of elements for mechanical equivalents and adaptation of the process using different materials and the like should be construed as being comprised within in the inventive concept as claimed.

10 References to ordnance in the above specification and claims shall be construed as non-limiting and in respect of the invention shall include without limitation shells, mortars, rockets, projectiles and any other ordnance or containers which are required to be filled with a combined final explosive mixture.

- 9 -

CLAIMS

- 1      Apparatus for the mixing of explosive materials, comprising;  
a reservoir of pre- mixed explosive material,  
a reservoir of hardener material,  
5      a static mixer means,  
each of said reservoirs having separate pipe means for conveying  
said pre-cure explosive material and hardener material  
respectively to a static mixer means.
- 10      2      Apparatus for the mixing of explosive materials in  
accordance with claim 1, wherein said materials are combined  
substantially at the inlet of said static mixer means.
- 15      3      Apparatus for the mixing of explosive materials in  
accordance with claim 1 or claim 2, wherein the outlet of said  
static mixer means is connected to means for effecting the filling  
of ordnance.
- 20      4      Apparatus for the mixing of explosive materials in  
accordance with any of claims 1, 2 or 3 wherein the means for  
filling each of said ordnance components with said combined final  
explosive material is controlled such that the respective pre-mix  
explosive material and hardener materials are introduced to the  
static mixer means on demand, the demand controlled by an  
25      automated ordnance fill level control means.

- 10 -

5           Apparatus for the mixing of explosive materials in accordance with any of claims 1 to 4 wherein said fill-to-level control means comprises at least one fibre optic sensor.

5           6           A method for the mixing of explosive materials utilising apparatus in accordance with any of claims 1 to 5.

10           7           A method for the mixing of explosive materials in accordance with claim 6, wherein the output from said static mixer is connected to apparatus for the filling of ordnance with explosive materials.

15           8           Apparatus for the mixing of explosive materials substantially as hereinbefore described with reference to the accompanying drawings.

9           A method for the mixing of explosive materials substantially as hereinbefore described with reference to the accompanying drawings.

20

- 11 -

## ABSTRACT

Apparatus for the mixing of explosive materials utilising a static mixer for combining pre-cure explosive material and hardener prior to introducing the combined mixture into any ordnance.
